Now, you've learned a few representative measures to estimate the impact of research, journal, and researcher. Based on those, discuss the following with your team members, and answer them.

1. Discuss an example where Impact Factor does not work well.

2. Discuss an example where H-index does not work well.

3. Discuss a method to classify a journal as "legit" or "fake" using either Impact Factor or H-index (or both together) such that it does not yield too many false positives (i.e., mistakenly labeling a legit journal as fake).
